Some classes (cyclostomes, osteichthyes fish and amphibians) have a larval stage. With rare exceptions, fish, amphibians, reptiles and monotreme mammals are oviparous; egg-laying (embryos develop within eggs and outside the mother's body), marsupial and placental mammals are viviparous (embryos develop inside the mother's body, feeding from her).

**Chordates—Biology Questions**

Classification quiz: Reptile, mammal, amphibian, fish. In this exercise, students will learn to distinguish if organisms fall under the categories earlier listed. Reptiles (example, lizard, crocodile) lay eggs and have a slender body. Amphibians (e.g. toad and frog) partly live on land and in water, mammals (e.g. man, money, dog) have bodies covered by hair, birds (e.g. parrot) have wings, lay eggs and have two limbs, fish (e.g. sharks) live in water.

**Classification quiz: Reptile, mammal, amphibian, fish**

In given cladogram, characteristic that separates bony fish from amphibians is 'lungs', as lungs are absent in bony fishes, while present in amphibians. Thus, the correct answer is option (D). Thanks. answered: j015. d. lungs.

Zoology staff survey rare animal species of all vertebrate groups (mammals, birds, reptiles, amphibians, and fish) and selected rare species from the invertebrate groups of butterflies and moths, beetles, dragonflies and damselflies, mayflies, and freshwater bivalve mollusks. Zoology staff also collect data on significant animal concentration areas.

**Rare Animals—NYS Dept. of Environmental Conservation**

Amphibians are vertebrate tetrapods. Amphibia includes frogs, salamanders, and caecilians. The term amphibian loosely translates from the Greek as “dual life,” which is a reference to the metamorphosis that many frogs and salamanders undergo and their mixture of aquatic and terrestrial environments in their life cycle.
