3: 5 (frogs to hamsters)

5: 8 (hamsters to all pets)

3: 8 (frogs to all pets) 8:

5 (all pets to hamsters) 8:

3 (all pets to frogs)

Proportions can tell us if two ratios are equal or not. Compare the ratio of hamsters to all pets and the ratio of brown-haired girls to all girls: $5/8 = 10/16$. $5: 8 = 10: 16$.

Proportions. An

equation that equates

two ratios is a

proportion. For

instance, if the ratio a/b

is equal to the ratio c/d ,

then the following

proportion can be

written : The numbers a

and d are the extremes

of the proportion. The

numbers b and c are the

means of the

proportion.

The idea of proportions

is that a ratio can be

written in many ways

and still be equal to the

same value. That's why

proportions are actually

equations with equal

ratios. This is a bit of a

tricky definition, so

make sure to watch the

tutorial!

A proportion is a name we give to a statement that two ratios are equal. It can be written in two ways: two equal fractions, or, using a colon, $a:b = c:d$; When two ratios are equal,

then the cross products
of the ratios are equal.

That is, for the
proportion, $a:b = c:d$, a
 $\times d = b \times c$

Answers

are equal. The proportion a / b is read as a is to b as c is to d .

The first and last terms (a and d) are called the extremes, and the middle terms (b and c) are called the means. There are several useful properties involving proportions, and these properties can be established using algebra.

answer: $(m+50)/10m$.

Explanation: The first term is m , so the second term is $m/10+5$ or $(m+50)/10$. When we take the ratio of the second term to the first term, we get $((m+50)/10)/m$, which

Download File
