We now write mathematically that the quantity of alcohol in x ml plus the quantity of alcohol in y ml is equal to the quantity of alcohol in 100 ml. $2\% x + 7\% y = 5\% 100$. The first equation gives $y = 100 - x$. Substitute in the last equation to obtain. $2\% x + 7\% (100 - x) = 5\% 100$. Multiply by 100 and simplify.

~~Mixture Problems With Solutions~~

The difference between Part a and Part b is that in Part b we don't know Selena's grade on the final exam. So instead of multiplying 30% times a number, multiply 30% times E. E is the variable that represents what Selena has to get on the final exam to get a 90 for the course. Set up the equation. $90 = 66.3 + 0.30E$.

~~Calculate percentages with Step-by-Step Math Problem Solver~~

Solving problems with percent. To solve problems with percent we use the percent proportion shown in "Proportions and percent". $a/b = x/100$. $a \cdot b = x \cdot 100$. $a = x \cdot 100 / b$. $x/100$ is called the rate. $a = r \cdot b \Rightarrow \text{Percent} = \text{Rate} \cdot B$
